

tournamentinfo.txt

I am building a for loop in R that populates variables with information about each player's name, state, total points, pre rating, and opponents. What are the character spacings in between each piece of information in this data?

 Done

Here's the character spacing breakdown based on the fixed-width format:

The data for each player spans **two rows** (with a separator line between each player). Here's how the columns are laid out:

Row 1 (player info):

- **Pair Number:** characters 1-4
-  separator at column 5-7
- **Player Name:** characters 8-39 (32 characters wide)
-  separator
- **Total Points:** characters 42-46 (5 characters wide)
-  separator
- **Opponents (rounds 1-7):** each round result takes 5 characters (e.g., ) , separated by 

Row 2 (rating info):

- **State:** characters 2-3
-  separator
- **USCF ID / Rating:** characters 8-39 — the pre-rating appears after  , roughly at characters 20-23

In short, the key spacings are:

- Pair number / State: cols 1-4
- Player Name / USCF+Rating: cols 8-39 (32 chars)
- Total Pts: cols 42-46
- Each round: 5 chars wide starting at col 48, each separated by |

For your R `for` loop, you'll likely want to use `substr()` with these positions, or use `strsplit(line, "\\|")` to split on the pipe `|` character, which is probably the cleanest approach given the consistent delimiter.
